Questions:

- 1) How would you represent testing of the application with multiple browsers?

Ans:

- By using Fork.(Concurrent Processes)

- 2) Can generation of the patch file and update the Subversion repository be done Concurrently?

Ans:

- No.
- Because, if the local copy is committed before generating a patch file, then local changes would get registered, and one won't be further able to generate the patch file.

- 3) Can patching the production code and updating the Subversion repository be done in Parallel?

Ans:

- Yes. Since we have already generated the patch file now we only need to upload that to production code and update the local repository to SVN. It is trivial to see that these two tasks can be done in parallel without any race conditions.
